

Business Requirements: Cyclistic Growth Strategy

Analyst: Ayush Patel

Date: May 14, 2026

1. The Problem

Cyclistic wants to increase annual memberships by understanding the behavior of casual riders and members. While casual riders generate short-term revenue, members provide more stable long-term value for the company.

The goal of this project is to identify riding patterns and support data-driven strategies that can help convert casual riders into members.

2. Scope of Analysis

- Analyzed 12 months of historical trip data
- Built a Tableau dashboard to compare rider behavior
- Focused on ride timing, ride duration, and station activity
- Used anonymized data to maintain rider privacy

3. Technical Workarounds

SQL Aggregation:

The dataset contained over 5 million rows, which created performance issues during analysis and visualization. To improve performance, SQL

aggregation was performed in Google BigQuery before importing summarized data into Tableau.

Coordinate Fixes:

Some station records had incomplete location details. SQL joins were used to retrieve accurate latitude and longitude values for major stations to improve map accuracy.

4. Measurement (KPIs)

- Peak ride hours for members and casual riders
- Weekday vs weekend usage patterns
- Average ride duration comparison
- High-demand stations and rider hotspots
- Areas with strong casual rider activity

PRIVACY AND COMPLIANCE NOTE

In accordance with data privacy best practices (GDPR: General Data Protection Regulation), all sensitive rider information (names, transaction methods) has been excluded.

5. Expected Outcome

This project is expected to help Cyclistic better understand customer behavior and identify opportunities to increase annual memberships through targeted marketing and operational strategies.
